## Preface

This book is written for mathematicians learning algorithms. The Algorithms that will be presented in this book are simple and do not require any prerequisites in mathematics. For those of you studying computer sciences, this book will provide you with the code of all elementary algorithms encountered in this book. The style we adopt in this book is simple. The presentation of the algorithms in pseudocode will not assume any background in mathematics or programming. This book will contain 7 chapters and the chapters focus will be the presentation of the algorithms that are related to the chapters. The first chapter is the introduction. The second chapter will contain algorithms in general. The third chapter presents algorithms of linear algebra. The fourth, fifth and sixth chapter will treat linear programming and linear programming mathematics. The seventh chapter presents the general representation of a linear programming. In chapter 8 we present the conclusion of the book.

# 1 Introduction

An algorithm is a set of instruction with precise characteristics. The characteristics of an algorithm are

- Precision
- Finiteness
- Uniqueness
- Generality
- Input-Output

**Definition 1.1.** *We understand under precision the possibility of an algorithm to be written with precised steps*

**Definition 1.2.** *The uniqueness occurs when the intermediate results of each step of execution are uniquely defined and depend on the inputs and the results of the previous steps.*

**Definition 1.3.** *We want to describe every algorithm as a finite characteristic. Finiteness means the algorithm will stop after finitely many instructions have been executed.*

**Definition 1.4.** *An algorithm will receive an input and produce an output*

**Definition 1.5.** *The algorithm will be applied to a set of input*

## 2 How to write Algorithms

The best way to describe an algorithm is to use the ordinary language. But many computer scientists and mathematicians prefer pseudocode because of its universality and structure. The pseudocode we write will resemble the Matlab language. Next to the pseudocode will be given the matlab version of the algorithm.

### 2.1 Finding the Maximum of Three Numbers

Algorithm 2.1.

```
function MAXIMUMTHREENUMBER( $a, b, c$ )  
   $x \leftarrow a$   
  if  $b > x$  then  
     $x \leftarrow b$   
  end if  
  if  $c > x$  then  
     $x \leftarrow c$   
  end if  
  return  $x$   
end function
```

Listing 1: Algorithm Maximum of Three Numbers

```
1      function x=MaximumThreeNumber( $a, b, c$ )  
2           $x = a$ ;  
3          if ( $b > x$ )  
4               $x = b$ ;  
5          end  
6          if ( $c > x$ )  
7               $x = c$ ;  
8          end  
9          end
```

This is a quite simple algorithm for determining the maximum of three numbers using the only if then structure. We assume that the maximum of the three numbers is  $x$ . We then start with the first number  $a$  with the if structure we update the value of  $x$ . At line 9 the value of the maximum of the 3 numbers is given and completes the algorithm.

## 2.2 Finding the Largest Element in a Finite Sequence

We can use the while loop structure to determine the largest number in a sequence  $S$

Algorithm 2.2.

```
function FINDLARGESTELEMENT( $S$ )  
   $large \leftarrow s_1$   
   $i \leftarrow 2$   
  while  $i \leq n$  do  
    if  $s_i > large$  then  
       $large \leftarrow s_i$   
    end if  
     $i \leftarrow i + 1$   
  end while  
  return  $large$   
end function
```

Listing 2: Finding the Largest Element in a Finite Sequence

```
1      function FindLargestElement( $s$ )  
2           $n = \text{length}(s);$   
3           $large = s(1);$   
4           $i = 2;$   
5          while ( $i \leq n$ )  
6              if  $s(i) > large$   
7                   $large = s(i);$   
8              end  
9               $i = i + 1;$   
10             end  
11              $\text{disp}(large);$   
12             end
```

## 2.3 Finding the Largest Element in a Finite Sequence

Algorithm 2.3.

```
function FINDLARGESTELEMENT( $S$ )  
   $n \leftarrow \text{length}(S)$   
   $large \leftarrow s_1$   
  for  $i = 2, \dots, n$  do  
    if  $s_i > large$  then  
       $large \leftarrow s_i$   
    end if  
  end for  
  return  $large$   
end function
```

Listing 3: Finding the Largest Element in a Finite Sequence

```
1      function FindLargest-Element( $s$ )  
2           $n = \text{length}(s);$   
3           $large = s(1);$   
4          for  $i = 2:n$   
5              if  $s(i) > large$   
6                   $large = s(i);$   
7              end  
8          end  
9           $\text{disp}(large);$   
10         end
```
